

ACORN

A self-improving curation layer on CNMF-E.

Drop in a recording -> get curated neurons -> the model learns from your review.

Automated CNMF-E Of Recording-Networks

BY THE NUMBERS · HUMAN CURATION BEHIND THE MODEL

88,000+ human-labeled cells · 261 sessions

Each carries a human keep/delete decision - made directly in ACORN review, or transferred from the lab's prior hand-curation by spatial matching (BLA + vCA1).

5 → 0

Parameters you set by hand. Estimated per session from the animal and the images.

13

Features scored per candidate: shape, trace quality, motion, correlation-map fit.

0.88

Real-vs-junk skill: ranks a real neuron above a junk one ~88% of the time. (AUC: 1.0 = perfect, 0.5 = a coin flip.)

~18%

Of the junk, auto-removed before you ever look at it.

<1%

Real neurons ever auto-rejected -- tuned to almost never discard a good cell.
